Principle of ELISA

1 Sandwich ELISA

IL-1 ELISA kit applies the quantitative sandwich enzyme immunoassay technique. The microtiter plate has been pre-coated with a monoclonal antibody specific for IL-1. Standards or samples are then added to the microtiter plate wells and IL-1 if present, will bind to the antibody pre-coated wells. In order to quantitatively determine the amount of IL-1 present in the sample, a standardized preparation of horseradish peroxidase (HRP)-conjugated polyclonal antibody, specific for IL-1 are added to each well to “sandwich” the IL-1 immobilized on the plate. The microtiter plate undergoes incubation, and then the wells are thoroughly washed to

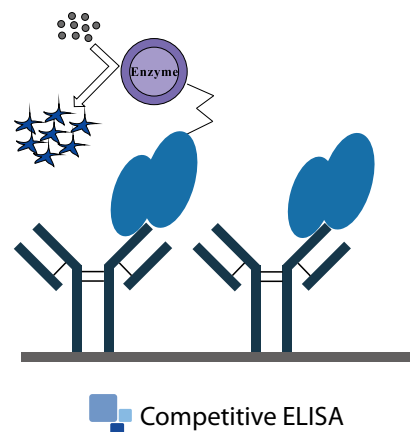

remove all unbound components. Next, substrate solution is added to each well. The enzyme (HRP) and substrate are allowed to react over a short incubation period. Only those wells that contain IL-1 and enzyme-conjugated antibody will exhibit a change in colour. The enzyme-substrate reaction is terminated by addition of a sulphuric acid solution and the colour change is measured spectrophotometrically at a wavelength of 450 nm. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The IL-1 concentration in each sample is interpolated from this standard curve.

2 Competitive ELISA

Cortisol ELISA kit applies the competitive enzyme immunoassay technique utilizing a monoclonal anti-Cortisol antibody and an Cortisol-HRP conjugate. The assay sample and buffer are incubated together with Cortisol-HRP conjugate in pre-coated plate for one hour. After the incubation period, the wells are decanted and washed five times. The wells are then incubated with a substrate for HRP enzyme. The product of the enzyme-substrate reaction forms a blue colored complex. Finally, a stop solution is added to stop the reaction, which will then turn the solution yellow. The intensity of color is measured

spectrophotometrically at 450nm in a microplate reader. The intensity of the color is inversely proportional to the Cortisol concentration since Cortisol from samples and Cortisol-HRP conjugate compete for the anti-Cortisol antibody binding site. Since the number of sites is limited, as more sites are occupied by Cortisol from the sample, fewer sites are left to bind Cortisol-HRP conjugate. A standard curve is plotted relating the intensity of the color (O.D.) to the concentration of standards. The Cortisol concentration in each sample is interpolated from this standard curve.

How to prepare samples

Serum

Use a serum separator tube and allow samples to clot for 2 hours at room temperature or overnight at 2-8°C. Centrifuge at approximately 1000 × g (or 3000 rpm) for 15 minutes. Remove serum and assay immediately or aliquot and store samples at -20°C or -80°C.

Plasma

Collect plasma using EDTA or heparin as an anticoagulant. Centrifuge samples for 15 minutes at 1000 × g (or 3000 rpm) at 2 - 8°C within 30 minutes of collection. Assay immediately or aliquot and store samples at -20°C or -80°C.

Tissue homogenates

The preparation of tissue homogenates will vary depending upon tissue type. For this assay, tissues were rinsed in ice-cold PBS (0.02mol/L, pH 7.0-7.2) to remove excess blood thoroughly and weighed before homogenization. Minced the tissues to small pieces and homogenized them in a certain amount of PBS with a glass homogenizer on ice. The resulting suspension was subjected to ultrasonication or to two freeze-thaw cycles to further break the cell membranes. After that, the homogenates were centrifuged for 15 minutes at 1500×g (or 5000 rpm). Remove the supernate and assay immediately or aliquot and store samples at -20°C or -80°C.

Cell culture supernatants and other body fluids

Centrifuge cell culture media at 1000 × g (or 3000 rpm) for 15 minutes to remove debris. Assay immediately or store samples at -20°C or -80°C.

NOTE

1. Samples should be aliquoted and must be stored at -20°C (less than 3 months) or -80°C (less than 6 months) to avoid loss of bioactivity and contamination. If samples are to be run within 24 hours, they may be stored at 2- 8°C. Avoid repeated freeze-thaw cycles.
2. Prior to assay, the frozen sample should be brought to room temperature slowly and mixed gently.
3. Samples containing a visible precipitate must be clarified prior to use in the assay. Care should be taken to minimize hemolysis. Do not use grossly hemolyzed or lipemic specimens.
4. Do not use heat-treated specimens.

Common Questions

ELISA

1. Do I have to run all of my standards and samples in duplicate?

Yes, the duplicates are run in order to monitor assay precision and increase confidence in the assay results obtained.

2. Do I have to run all of my samples at one time?

No, each kit uses stripwell microplate. This allows the user to analyse different numbers of samples at different times.

3. What type of reproducible results are obtained with the assays?

Each kit comes with a manual containing a graph of typical data obtained. Any variation in operator, pipetting and washing technique, incubation time or temperature, and kit age can cause variation in result. Each user should obtain their own standard curve.

4. Is it possible to store the reagents other than indicated?

Storage of the kit components under conditions other than indicated is not recommended in order to assure proper performance of the test.

5. How should I store my samples?

Samples should be stored at -20°C or lower temperature. For long-term storage, it is recommended to freeze them at -70°C -80°C.

6. Can I modify the protocol?

BG ELISA kits have been optimised to provide the best possible results. Modifying the format or protocol may give inaccurate and wrong results.

7. Can I use a sample type that is not recommended in the kit insert?

The kit has been validated for the sample types listed in the kit insert. Sample types other than those validated have not been tested. Contact Technical Service for further information.

8. My samples generated values that were outside the dynamic range of the assay. Can I use these values?

It is recommended that only sample values that fall within the range of the standard curve be used. Values outside the range of the standard curve are generally non-linear, which can lead to incorrectly extrapolated values. Samples that generate values higher than the highest standard should be (further) diluted and the assay repeated. If samples fall below the range of the assay, the sample is considered to be non-detectable.

9. Do I have to run a Blank, or Zero Standard every time?

Yes, these are required for the calculations, and reflect any subtle but significant performance changes from day to day and assay to assay. They are also extremely helpful when troubleshooting the source of a particular assay problem.

10. Can I alter the volume of sample I use in the assay?

It is not recommended that you alter the volumes since all BG kits are designed for optimal performance at the given volumes.

11. Can components from different kits be used?

Each kit contains components which have specific lot numbers to ensure that all of the components are performing optimally alone, as well as with all of the other components in the kit. QC testing is performed on these specific lots. It is never recommended to use your own components or components from other kits or vendors.

12. My standard curve looked fine, but I didn't get a signal in my sample when I expected to, why?

Common Questions

The sample may not contain the analyte. A matrix effect may be masking the detection. Ensure that the recommended dilution was followed as stated in the kit insert. If dilution was recommended, check to be sure that the dilution was performed properly. Over-dilution may cause the sample to fall below the range of the standard curve.

13. How do you recommend I wash my plate?

If you are using an automated plate washer we recommend that the calibration be checked on a regular basis, and that the system is flushed with the Plate Washing Buffer prior to washing. The same is true for a manual washer. A repeater or a wash bottle can also be used. The user should be careful to ensure that all of the contents are aspirated and the plate tapped dry on lint-free paper.

14. Do I need to use a plate shaker?

Reliable results can be obtained without a plate shaker, but the O.D.'s will generally be lower than those obtained using a plate shaker.

15. Why do I have to use wavelength correction between 450-570nm?

For the ELISA assay, reading at dual wavelengths is done to correct for the optical density contributed by the plastic well, the lamp and optical fluctuations.

16. If I extract my sample, do I still need to follow the recommended dilutions given in the kit insert?

The amount of sample dilution needed after an extraction procedure will be affected by the effects of purification and concentration in the protocol used. The amount of dilution or concentration will have to be determined by the end-user.

17. What is the expected concentration of analyte that I should expect to find?

The amount of a given analyte may vary not only from species-to-species, but also between tissue and cellular sources. The best source of this information is the current literature that is easily accessed through the Internet at multiple scientific databases.

18. My optical densities were a little higher (or lower) than those in the manual that came with my kit. Why?

The optical density is affected by a number of physical conditions such as time and temperature. We suggest that you shorten or lengthen the final incubation with substrate solution to compensate.

19. What are the reasons for High Background?

Improper Washing: Check volume of washing buffer reservoir and make sure all recommended washing steps are performed.
Contaminated Substrate: Make sure there is no contamination of the substrate with metal ions or oxidising reagents, before use. Keep the extra substrate solution separately during the ELISA substrate development time.
Substrate exposed to light: Exposure to light may result in a blue color of the substrate. Keep solutions in the dark (vial) until ready to dispense into the plate.
Wrong Incubation Times/Temperatures: Generally follow the test protocol regarding incubation times and temperatures. However, if all wells are intensely and equally coloured with no intensity gradient observed in the standard dilution series, then it may be necessary to observe the substrate reaction as the colour is developing, in order to stop the reaction sooner.

Advantages of BG ELISA kits

1. About the antibodies in the kit

As you know, the quality of antibodies and antigens is very important in Elisa systems. We make our own antibodies as well as sourcing other excellent antibodies from a variety of suppliers to ensure the quality of our Elisa kit.

2. About the enzyme in the kit

Our enzyme is very stable with unique protective agents.

3. About the standards in the kit

The standards concentration is very critical to get accurate standard curves. Our company does not want our customers to dilute the standards by themselves. Therefore, we do not provide a bottle of concentrated standards but provide serial concentration-known standards. Our standards concentration is accurate (tested before sub-packaging). This can ensure the accuracy of the standards curves. Our standards are provided in liquid in a glass bottle. The whole kit contents can be stored at 2-8 °C . It is very convenient to be transported and stored. Unlike some products, the standards must be transported and stored at -20 °C .

4. About the Elisa systems

Our competitive and sandwich ELISA assays need only one incubation and one wash steps. The whole Elisa experiment can be done within 90 minutes. Compared to the traditional Elisa methods, fewer handling steps can produce less errors and more consistent results. We also tested all the systems to make the intra and inter assay precision high and coefficient of variation as small as possible.
